## / Get acquainted with Proget MDM platform

Specialised in mobile  
devices security

# Benefits of using the MDM platform

## Find out what you can gain!

Proget MDM combines easy and intuitive use with a vast array of available functions. The solution is developed entirely by our programmers and it is not subject to the strict rules imposed by large corporations. We can freely adapt to the needs and requirements of our Customers.

Proget MDM offers high level of data security, regardless of whether the devices are owned by the company or employees who use them for business in the BYOD scenario.

# Explore our application and administration panel

## Manage your phones in a simple and transparent way

### Information

Here you will find basic information about the application, end-user licence and the corporate server to which the device is connected.

### Pomoc techniczna

Tab in which you will find the most useful contact information. In case of problems, our consultants will help to solve them.

### Device

Here you will find the most important device data. You can check the system version, battery level, space taken, which network you are connected to or which profiles are currently configured on this device.

### Messages

List of messages received from administrators. The list also shows alarm messages that can be sent in case of an emergency.

### Applications

Company application shop. Information on applications ordered to be installed by your company or applications that have already been installed remotely on your device.

### Files

File manager. It is used to browse files that were made available by the administrator.

# Are you ready for the GDPR?

Check out our platform at [www.proget.pl](http://www.proget.pl)

The General Data Protection Regulation entered into force on 25 May 2018.

- secure and control mobile devices
- encrypt corporate data on devices
- protect data transmission with an encrypted VPN channel
- control applications and determine the access to them
- safely remove data from devices

## Is the data in your company secure?

Check and find out that the protection of the fleet of Android, iOS, Windows devices does not have to be complicated.

Usually, when we think about the security of important corporate data we take into account the equipment that we have in the company.

We often forget that employees store a whole sensitive database, including emails with attachments, contacts, photos and other confidential data, on mobile devices.

The Proget MDM platform was developed based on long-standing experience and therefore it offers multiple reliable but also original solutions.

# Key functions of the MDM platform

## Device feature control

A company device is subject to safety policies in accordance with the company requirements, creating hardware and system constraints.

## Geolocation of devices

Thanks to Proget MDM, devices may be located on demand, in a given time interval or in motion, creating track and route history.

## Data encryption

We encrypt data with the use of high-standard cryptographic algorithms and thanks to security updates the system is resistant to all susceptibility.

## Remote wipe

It allows to erase the entire memory of the device or only the company data, ensuring the protection of sensitive data against unauthorised access.

## Application distribution

Distribution of own applications blocking certain software, e.g. Facebook, and creating white and black lists offers great opportunities to rule the application world.

## Corporate standard

We integrate business services such as email, calendar, contacts, but we also provide enhanced features such as VPN, file access, intranet, proxy and many other.

## Remote desktop

This functionality allows remote access to mobile devices which greatly supports problem-solving by the IT Department.

## Expansion and adjustment

Proget MDM is not merely a closed platform, it is a framework that we use for customisation. We will provide you with a tailor-made software in which each detail corresponds to your concept.

# Integrations

Proget is the only producer open to the needs of Customers. We talk to our Customers about their real needs regarding the MDM system. If integration with an unusual system or service (SIEM, DLP, ERP, CRM and others) is required, our R&D Department will establish whether the implementation is possible from a technical point of view and how much time is needed for the implementation. If it is necessary to modify the control panel, add new features, options, buttons, reports, just arrange it with us and we will be able to offer a system modification so as to adapt the Proget MDM platform to your needs and expectations. No other producer offers such possibilities with regard to adjusting to individual needs of the Customer!

## Android Enterprise (Android For Work)

Android Enterprise separates business applications from personal applications. Use efficiency, flexibility and capacity of Android in your work - the best applications at your disposal, any time, any place. Create a special work profile solve the issue of data specification with this technology. Secure confidential data in the highest possible standards.

## Samsung KNOX

Samsung KNOX allows users to create separate space for secure storage of business applications and electronic mail, isolating them from the data in private space. This allows IT administrators to remotely set up securities and manage company data without having access to users' private data.

## Samsung Enterprise FOTA (E-FOTA)

Samsung Enterprise Firmware-Over-The-Air allows companies to control update schedules and versions of operating systems in employees' devices. Administrators can test updates prior to their implementation in order to ensure compatibility between the corporate applications and new systems.

## Apple DEP

Thanks to DEP, global distribution of iPads and iPhones is completely touchless. Automatic enrollment through MDM is available for all devices, thanks to which they are immediately configured along with the account settings, applications and access to corporate services via the Internet during their activation. Apple DEP activates the supervised mode touchlessly. This enables the configuration of the device by any means and the Allow open-in policy provides full system support for data specification.
